

Demo Program Installation Instructions

When you download, run and unzip the demo file, it will create a folder on your c: drive named MessageSuiteV2Install. You need to open Windows Explorer, open the c:\MessageSuiteV2Install folder and right mouse click on the setup file and select Run as Administrator.

If that option is not available, go ahead and run the setup program anyway. This process will create the c:\MessageSuiteV2 folder with all the files, put a shortcut on your desktop and check your system for the .Net Framework installed and begin the installation of version 4.6 if your computer has an older version. Complete that process before proceeding. If you don't have 4.6 installed and the installation process does not begin, run NetFramework46 in c:\MessageSuiteV2Install.

After the program is put in place on your computer and you attempt to run it, depending on what Access system files are already installed on your computer, you may receive the following error messages.

1. The first message would tell you "Microsoft.ACE.OLEDB.12.0 provider not registered". To resolve this, run AccessDatabaseEngine in c:\MessageSuiteV2Install. This will install the Microsoft Access system files that are needed.
2. The second message would tell you "Unrecognized database format". To resolve this, run AccessConnectivitySP3 in c:\MessageSuiteV2Install. This will install the Microsoft Access system files that are needed.

The Administrator password in admin.
